Precise phase of the moon indications deviate from the synodic or mean moon by one day after a few of hundred years; Andreas Strehler's phase of the moon after two million years. This has won the Sauterelle à lune perpetuelle an entry in the Guinness Book of World Records.

However, all phase of the moon indications have a common problem: As precise as they may be, they cannot be read very precisely: Except at new moon and at full moon, the wearer of the watch has to guess what the exact phase or age of the moon is. Also, the exact setting of the moon phase indication is only possible at new moon and full moon.

Andreas Strehler has changed this with the first precise phase of the moon indication.

The Lune exacte can be read and set correct to three hours at any time and not only every fortnight, thanks to its new and patent pending Vernier scale mechanism. This high precision moon age indication gives the age of the moon in days and further increments of three hours.

The world's most precise phase of the moon is now also the most exact.
